

Assays for transcription and protein levels

Module 3, Lecture 5

20.109 Spring 2010

Topics for Lecture 5

- Measuring protein levels
- Measuring transcript levels
- Module 2 report revision

Please sit toward the front, as my voice is strained due to illness. Thank you!

Module overview: 2nd half

1. Enzymatic digestion

Test for collagen proteins (by ELISA)

2. EDTA-citrate dissolution

Purify mRNA from cells ———> Amplify collagen cDNAs ———>

Compare collagen I and II transcript levels, normalized to GAPDH

Antibodies are specific and diverse

- Specificity
 - variable region binding, $K_D \sim \text{nM}$
 - linear or conformational antigens
- Diversity
 - gene recombination
- Production
 - inject animal with antigen, collect blood
 - hybridomas (B cell + immortal cell)

Day 5-7: protein analysis by ELISA

- ELISA: enzyme-linked immunosorbent assay

- specific
- sensitive
- multiple kinds

“blocking” step
also needed

△ = protein
of interest

Common protein-level assays

- PAGE

- simple and low cost
- Coomassie detection limit $\sim 0.3\text{-}1$ $\mu\text{g}/\text{band}$ (2-5 ng/band for silver staining)
- cannot distinguish two proteins of same MW

- Western blot

- identifies specific protein
- detection limit ~ 1 pg (chemiluminescent)
- only simple for denatured proteins

- ELISA

- detects native state proteins
- quantitative
- high throughput

Current Protocols in Cell Biology, Molecular Biology

Day 4-5: transcript analysis

- Last time: RT-PCR
 - Collagen II + GAPDH
 - Collagen I + GAPDH
- Next: run out on a gel
- Measure band intensity/area
 - low dynamic range
 - exposure time
- Controls/references
 - GAPDH loading control
 - fresh stem cells
 - fresh chondrocytes

Common transcript-level assays

- RT-PCR (end-point)
 - simple, low cost
 - can be semi-quantitative
- Microarrays (end-point)
 - high cost, need specialty equipment
 - complicated and fraught analysis
 - high throughput
- q-PCR (real-time)
 - some special equipment, medium cost
 - highly quantitative
 - multiplexing potential
 - require optimization (primers)

Current Protocols in Cell Biology, Molecular Biology

Introduction to qPCR

- Real-time tracking of DNA production
- Uses probes that fluoresce
 - when bind to any DNA
 - when bind to specific DNA (FRET)
- Why does PCR plateau?
- Several analysis methods
 - threshold cycle C_T
 - relative standard curve: fold-change of a transcript (normalized)
 - efficiency-correction: compare genes
 - absolute levels by radiolabeling

Current Protocols in Cell Biology, Molecular Biology

Module 2 revision: small but important points

- Words have precise meanings
 - e.g., “significantly”
- Numbers imply a claim
 - excess digits often reported
- In results, be descriptive, not jargony or methods-oriented
 - e.g., “lysis solution” vs. “BPER”
 - e.g. “aligned sequence with WT” vs. “used BLAST”
 - e.g., explain “diagnostic digest gel”
- Avoid wiki language:
 - 1) it’s plagiarism, and 2) it has a different purpose/audience than your report (most egregious e.g., “protein behavior assay”)
- Italicize enzyme names (e.g., *AccI*)

Module 2 revisions: writing and analytical examples

- Data analysis
 - Subtleties in SDS-PAGE data
- Read excerpts demonstrating
 - Appropriate abstract content
 - Sufficient narrative in a results section
 - Concise but thorough analysis
 - Effective opening for discussion section

Lecture 5: conclusions

- Antibodies to diverse targets (e.g., proteins) can be made and used for detection/measurement.
- Trade-offs exist (e.g., between simplicity and accuracy) for different transcript-level assays.

Next time: cartilage TE, from *in vitro* and *in vivo* models to the clinic; imaging.
