

### Correction to M1D5 (-ANS)

The banding pattern shown for the *Bam*HI/*Xho*I digest of a plasmid containing multiple inserts is incorrect! There is no 650 bp band. The first two inserts are surrounded by *Bam*HI cuts, rather than being split by a *Bam*HI cut. It just so happens that this band size is ~1300 bp, very similar to the ~ 1200 bp band that spans the distance from the final *Bam*HI site to the *Xho*I site. You would probably see a doublet or smear on the gel, still allowing you to distinguish this plasmid from the single insert case.
